Paul Davis Restoration installs highly sophisticated and ecologically safe Ultrasonic contents cleaning system and additional high technical cleaning methods

Charlotte, NC – December 3, 2010 - Paul Davis Restoration and Remodeling of Charlotte owners Abbie and Scott Bailey recently announced the purchase and installation of an Omegasonics ultrasonic cleaning system which features ecologically safe, cutting edge technology. The system supports the company's contents cleaning program which provides computerized inventory control, pack-outs, storage, and cleaning of residential and commercial site content materials damaged by fire, water, mold, smoke, soot, and vandalism, just to name a few.

According to Scott Bailey, the new system will clean items that previously would have been impossible to save. "We can now handle very large jobs in much less time as far as contents cleaning is concerned," said Bailey. "The Omegasonics Pro 5224 Unit uses micron-sized cavitation bubbles to clean places hand cleaning can't reach. The system quickly restores fire-damaged electronics, crystal, china, figurines, pewter, brass and much more," he said. "This means that we can serve our customers by replacing less of their valuables and restoring more of their precious possessions. We chose ultrasonic cleaning because the system cleans and works faster and safer than any other method, without using toxic solvents."

The insurance industry also benefits from the use of the system and its speed and thoroughness. In addition to drastically increasing the labor efficiency with which contents are handled, this technology gives Paul Davis the ability to clean and restore contents that were once considered non-salvageable. The results increase customer satisfaction and can reduce total claim costs for the insurance company.

Paul Davis Restoration also uses a variety of other new high tech cleaning and deodorizing methods. One of the newest cleaning methods used by Paul Davis Restoration is with hydroxyl generators which provide a heavy concentration of hydroxyl molecules to treat large areas affected by fire, smoke, mold, sewage, and any other odor problem. Hydroxyls are safe, naturally occurring molecules that are created in our atmosphere when the sun's ultraviolet rays react with water vapor. Technicians use this method to decontaminate, deodorize and purify the air. The green technology is safe to breathe and can help to lower insurance claim costs by allowing homeowners to stay in their home instead of incurring additional living expenses.

"We are constantly searching for cleaning methods to provide exceptional customer service. Our company is renowned for utilizing the latest equipment and technologies to benefit our customers," said Bailey

###
